PARTICLE ACCELERATOR PROJECTS
AND UPGRADES

For Industry Collaboration in the Field
of Particle Accelerators

13th Edition

Compiled by
Centro Nacional de Pesquisa em Energia e Materiais – CNPEM
INTRODUCTION

“For many years, the European Physical Society Accelerator Group (EPSAG) that organizes the IPAC series in Europe has contacted major laboratories around the world to invite them to provide information on future accelerator projects and upgrades to exhibitors present at IPAC commercial exhibitions. This initiative has resulted in a series of booklets that is available to industry at the conferences or online. This current edition builds on previous editions with updated information provided by the laboratories and research institutes. We would also like to acknowledge and thank everyone for contributing to this booklet in an effort to foster a closer collaboration between research and industry.”*

All of the information contained in this booklet is subject to confirmation by the laboratory and/or contact persons for each project.

The past 2020 booklet still containing relevant information. We could update just part of it. Visit the site https://www.ipac20.org/particle-accelerator-projects-and-upgrades/ to access this material.

Inquiries for this edition may be directed to:

*IPAC20 Particle Accelerator Projects and upgrades
CONTENTS

Introduction

PROJECT REGION: AMERICAS

BELLA 2nd Beamline and iP2

Status of the Advanced Photon Source Upgrade (APS-U) Project

The Cornell-BNL ERL Test Accelerator (CBETA)

The Proton Power Upgrade Project at the Spallation Neutron Source (SNS)

PROJECT REGION: ASIA

Australian Synchrotron BRIGHT beamline expansion

Australian Synchrotron Operational Upgrades

China Spallation Neutron Source

Establishment of Heavy Ion Medical Accelerator

HIAF (High Intensity heavy ion Accelerator Facility)

RAON

RIBF upgrade project

Siam Photon Source-II (SPS-II) accelerator complex

Third RF station for storage ring of Taiwan Photon Source

PROJECT REGION: EUROPE

Diamond II

European Spallation Source (ESS)

Future Circular Collider (FCC) Feasibility Study

High Luminosity LHC (also: HiLumi LHC, HL-LHC)

IFMIF-DONES

MYRRHA (phase 1 – Implementation)
PROJECT REGION:
AMERICAS
**BELLA 2nd Beamline and iP2**

</tr>
<tr>
<td>Project Description:</td>
<td>Two projects are extending the capability of the BELLA Center facility to advance the capability to develop Laser-Plasma Accelerators, based around the Center’s Petawatt laser. The existing facility features a single long focal length laser beamline which has been used to accelerate electrons up to 7.8 GeV, and protons up to several MeV. The first project will enable splitting of the laser pulse to deliver two independent pulses to the interaction point, supporting chaining of two laser-plasma accelerator stages at the multi-GeV level. This will be a critical step in establishing that such accelerators can meet future collider needs. It extends the existing program which is aligned to address the principal issues for a future lepton or photon collider at or above the TeV scale, including efficiency, beam quality, and energy gain. The second project will install a short focal length interaction chamber on the system. This will enable testing of novel ion acceleration regimes such as radiation pressure, to reach higher energies and beam quality. The two projects will also create a versatile facility enabling a broad range of other experiments at high repetition rate and precision.</td>

<tbody>
<tr>
<td>Project Type:</td>
<td>Advanced Photon Source Upgrade (APS-U) Project</td>
</tr>
<tr>
<td>Project Description:</td>
<td>The APS-U Project replaces the existing 1.1-km circumference, 7-GeV electron storage ring with a new very low emittance, 6-GeV 7BA lattice to increase spectral brightness and transverse coherence for X-rays &gt;10 keV by two to three orders of magnitude. Nine state-of-the are X-ray beamlines will be built, and enhancements made to 15 existing beamlines. New permanent magnet and superconducting undulators will be provided. While the present RF cavity system will be preserved, virtually all other accelerator components will be replaced. The replacement of the present klystron-based RF power sources with solid state amplifiers is in process, but not included in the Project.</td>
</tr>

The Proton Power Upgrade Project at the Spallation Neutron Source (SNS)

<table>
<thead>
<tr>
<th>Project Location:</th>
<th>USA</th>
</tr>
</thead>
<tbody>
<tr>
<td>Project Type:</td>
<td>Upgrade</td>
</tr>
<tr>
<td>Project Description:</td>
<td>The Proton Power Upgrade Project at the Spallation Neutron Source (SNS) at Oak Ridge National Laboratory (ORNL) will double the proton power capability from 1.4 to 2.8 MW. This will be accomplished through an energy increase from 1.0 to 1.3 GeV and a beam current increase from 26 to 38 mA. The energy increase will be accomplished through the addition of 7 cryomodules to the linear accelerator (Linac). The beam current increase will be supported by upgrading several radio-frequency systems in the normal-conducting section of the Linac. Upgrades to the accumulator ring injection and extraction regions will accommodate the increase in beam energy. A new 2-MW-capable target and supporting systems will be developed and installed. Conventional facility upgrades include build-out of the existing klystron gallery and construction of a tunnel stub to facilitate future beam transport to the second target station. The project received approval to proceed with construction in October 2020. Procurements are in progress, and some installation activities have already occurred. Most of the installation will take place during three outages in 2022-2023.</td>
</tr>

**HIAF (High Intensity heavy ion Accelerator Facility)**

<table>
<thead>
<tr>
<th>Project Location:</th>
<th>People Republic of China</th>
</tr>
</thead>
<tbody>
<tr>
<td>Project Type:</td>
<td>New Project under construction</td>
</tr>
<tr>
<td>Project Description:</td>
<td>HIAF is a new accelerator facility for advances in the nuclear physics and related research fields in China. The HIAF facility plan was approved by central government of China in December 2012 and now is under construction. The design concept and layout of HIAF facility have evolved from the scientific requirements. The whole layout of HIAF accelerator consists of superconducting ECR source, superconducting linac as injector, synchrotron booster, radioactive beam separator, and storage rings for in-ring experiments. ECR source is the next generation ECR source with high operation frequency, the superconducting linac can provide the highest intensity heavy ion beam for low energy research and synchrotron injection. The output energy is the about 17-25MeV, we keep the free space for update to 100MeV/u in the future. The central part of the HIAF facility is a synchrotron complex consisting of two rings. Both rings have nearly the same circumference and will be installed in the same tunnel. A series of new and innovative technologies have adopted for HIAF, the prototypes have been developed for these technical challenges and critical issues for the variation of the feasibility, reliability and performance. The machine design was optimized based on these prototypes developments, details of technical design has been finished and some hardware systems already go into production. The civil construction and common system are also going smoothly.</td>
</tr>

# Siam Photon Source-II (SPS-II) accelerator complex

<table>
<thead>
<tr>
<th>Project Location:</th>
<th>Thailand</th>
</tr>
</thead>
<tbody>
<tr>
<td>Project Type:</td>
<td>New Project</td>
</tr>
<tr>
<td>Project Description:</td>
<td>Siam Photon Source-II (SPS-II) accelerator complex is the second synchrotron light source in Thailand. It consists of three main components: a 150 MeV injector linac, a 3 GeV full energy booster synchrotron, and a 3 GeV electron storage ring. The booster structure is a modified FODO lattice with defocusing quadrupole fields combined in bending magnets. Circumference of the booster synchrotron is 307 m. It is designed to share the same tunnel with the storage ring. The 3 GeV storage ring has a circumference of 321 m and the electron beam emittance of 0.9 nm-rad. The ring consists of 14 Double Triple Bend Achromat (DTBA) cells, resulting in 14 long and 14 short straights. Maximum stored beam current will be 300 mA. Beam injection to the storage ring is executed with a Pulsed Multipole magnet, which is designed based on the Non-Linear Kicker (NLK) magnet developed for BESSY-II. The storage ring RF system has a frequency of 119 MHz with the accelerating voltage of 2.2 – 3.6 MV. All the RF cavities are normal conducting and the RF power is supplied by solid-state RF amplifiers together with Digital Low-Level RF (DLLRF) controllers. Third harmonic cavities (Landau cavities) will be installed to suppress beam instabilities. Stainless steel is the preferred material for SPS-II vacuum chambers.</td>

### Future Circular Collider (FCC) Feasibility Study

<table>
<thead>
<tr>
<th>Project Location:</th>
<th>Switzerland and France</th>
</tr>
</thead>
<tbody>
<tr>
<td>Project Type:</td>
<td>New Project</td>
</tr>
<tr>
<td>Project Description:</td>
<td>Investigating the technical and financial feasibility of a future hadron collider at CERN with a centre-of-mass energy of at least 100 TeV and with an electron-positron Higgs and electroweak factory as a possible first stage. Complementing the placement and layout optimization, the feasibility study includes the refined design of both colliders and their injector chains, along with targeted R&amp;D programmes to develop the needed accelerator technologies and the technical infrastructure.</td>
</tr>
<tr>
<td>Requirements List Available:</td>
<td>No; Product Breakdown Structure under development</td>
</tr>
<tr>
<td>Approval Date:</td>
<td>2028 (expected)</td>
</tr>
<tr>
<td>Status of Contracting:</td>
<td>R&amp;D phase</td>
</tr>
<tr>
<td>Construction scheduled to start:</td>
<td>2030 (expected)</td>
</tr>
<tr>
<td>Estimated Project Cost:</td>
<td>7,400 MCHF for civil engineering and technical infrastructure; 3,100 MCHF for e⁺e⁻ Z, W, H factory plus additional 1,100 MCHF for e⁺e⁻ top factory; 17,500 MCHF for hadron collider following e⁺e⁻</td>
</tr>
<tr>
<td>Estimated Construction Duration:</td>
<td>≥10 years</td>
</tr>
<tr>
<td>Type of Equipment to be Purchased:</td>
<td>Nb₃Sn accelerator magnets with a field of about 16 T, SRF cavities with a frequency in the 400-800 MHz range, efficient RF power sources, vacuum chambers appropriate for high synchrotron radiation, advanced cryogenics, novel manufacturing techniques, warm accelerator magnets, collimation system, etc.</td>
